TITLE: An analysis of the toxic effect of oxygen according to reactions of phosphorylizing respiration, and the protective effect of SH-radical donors

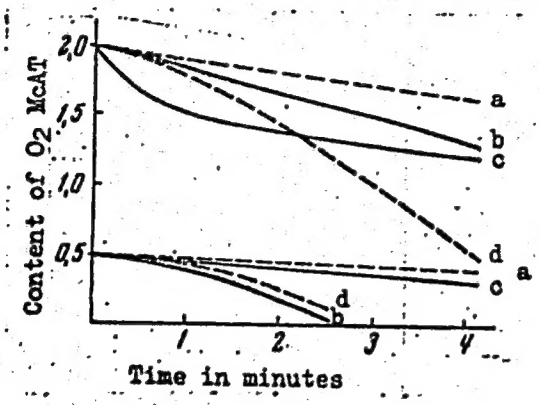
SOURCE: Simpozium Struktura i funktsii mitokhondriy. Moscow, 1965. Mitokhondrii; struktura i funktsii (Mitochondria; structure and functions); materialy simpoziuma. Moscow, Izd-vo Nauka, 1966, 155-156

TOPIC TAGS: hypoxia, phosphorylation, [redacted], biologic respiration, cell physiology, hyperoxia, toxicology, mouse, oxygen, drug effect

ABSTRACT: Tests were performed to discover methods of eliminating hypoxia and reducing the toxic effect of high concentrations of oxygen. Mitochondria from the livers of white mice were kept in an incubation medium with a normal and an increased oxygen content. A polarographic record of respiration was made, and the pattern of toxic effect was

Card 1/3 UDC: none

determined according to the reversible elimination of respiratory control (M. N. Kondrashova and L. I. Kikolayeva). Test results are presented in Fig. 1. The addition of cysteine eliminated the toxic effect of oxygen, but, under certain conditions, an increase in its concentration can induce inhibition Fig. 1. Elimination of respiratory



control by oxygen and its reestablishment by cysteine. The incubation medium contained per 1 milliliter: 200 micromoles of sucrose, 15 micromoles of KCl, 20 micromoles of KH_2PO_4, 10 micromoles $MgCl_2$, 10

ACC NR: AT7004077

micromoles of succinate, and 50 micromoles of ATP. Tests with an acceptor contained in addition: 0.03 mg of hexokinase, 9 mg of glucose. Cysteine was introduced in a final concentration of $5 \cdot 10^{-4}$ M. a - Tests without hexokinase, but with cysteine; b - tests with hexokinase, but without cysteine; c - tests without hexokinase and cysteine; d - tests with hexokinase and cysteine of oxidative phosphorylation. Test data indicate that the use of SH-radical donors can increase the effectiveness of oxygen therapy and reduce toxic side effects. Orig. art. has: 1 graph.

TITLE: Manufacture, on Stands, of Precast Prestressed Reinforced Concrete Beams (Opyt izgotovleniya predvaritel'no napryazhennykh zhelezobetonnykh balok na stende)

PERIODICAL: Beton in zhelezobeton, 1958, Nr 10, pp 386-388 (USSR)

ABSTRACT: Manufacture of precast prestressed reinforced concrete beams in factory "Stroydetal" Nr 2 of the [illegible] trust "Krivorozhstroydetal'" is described. Hydraulic jack SM-513 (shown in Fig 1) with a capacity of 60 t, was used for tensioning. The stand is 84 m long and 4 m wide. The beams are 18 m long, shaped as in Fig 2. The beam was designed by Khar'kov branch of Promstroyproyekt. At present the reinforcement consists of 5 mm diameter high tensile, cold rolled wires of standard profile UMTU 4987-55. A detailed description of the concrete vibrator I-116 is used. Curing begins at a temperature of up to 70°C for a duration of 4 hours: the curing itself is carried out at the same temperature for 14 hours, and during termination of curing the temperature drops down to 20°C over a period of 6 hours. The reinforcements are cut by means of a metal cutting

Card 1/2

Cyclamen synthetic odor. S. S. Nametkin and V. I. Klimova. *Sintezy Dushistykh Veshchestv, Sbornik Statei* 1939, 44-55; *Khim. Referat. Zhur.* 1940, No. 4, 111-12.—The condensation of benzene with geopriene in the presence of $AlCl_3$ gave a 50% yield of cumene. Treatment of this in a 1:1 mol. ratio with CH_2O in a current of HCl gas gave an 80-85% yield of cumyl chloride, from which there was obtained a 65-70% yield of cumaldehyde by the action of hexamethylenetetramine (slightly dild. in alc.) for 2 hrs. Propionaldehyde was obtained in 50-7% yield by dehydrogenation of PrOH over a Ag gauze catalyst in a chamber preheated to 400° and at a current velocity of 1.2 l./min. Cumaldehyde was condensed with propionaldehyde in 2.5% alc. alkali soln. at 25-30° for 4 hrs., giving a 60-65% yield of *p*-isopropyl-α-methylcinnamaldehyde. Hydrogenation of this compd. over Ni pyrophosphate at 60° gave a mixt. of *p*-isopropyl-α-methylhydrocinnamaldehyde and *p*-isopropyl-α-methylhydrocinnamic alc., difficult to sep. The alc. can be oxidized to aldehyde over a Ag catalyst in air at reduced pressure, but the odor of the product is inferior to that of the mixt. obtained by hydrogenation. W. R. Henn

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 19, 1965, 70

TOPIC TAGS: leather, polymer, protein, vinyl plastic, acrylic plastic

ABSTRACT: This Author Certificate presents a method for obtaining film-forming and impregnating materials for trimming and filling of natural and artificial leather by modification of vinyl, for instance, acrylic and methacrylic monomers by means of proteins. To increase the thermal, acetone, and water stability of coatings and the durability and filling of the material structure, the starting monomers are emulsified in an aqueous protein solution. The emulsification is followed by

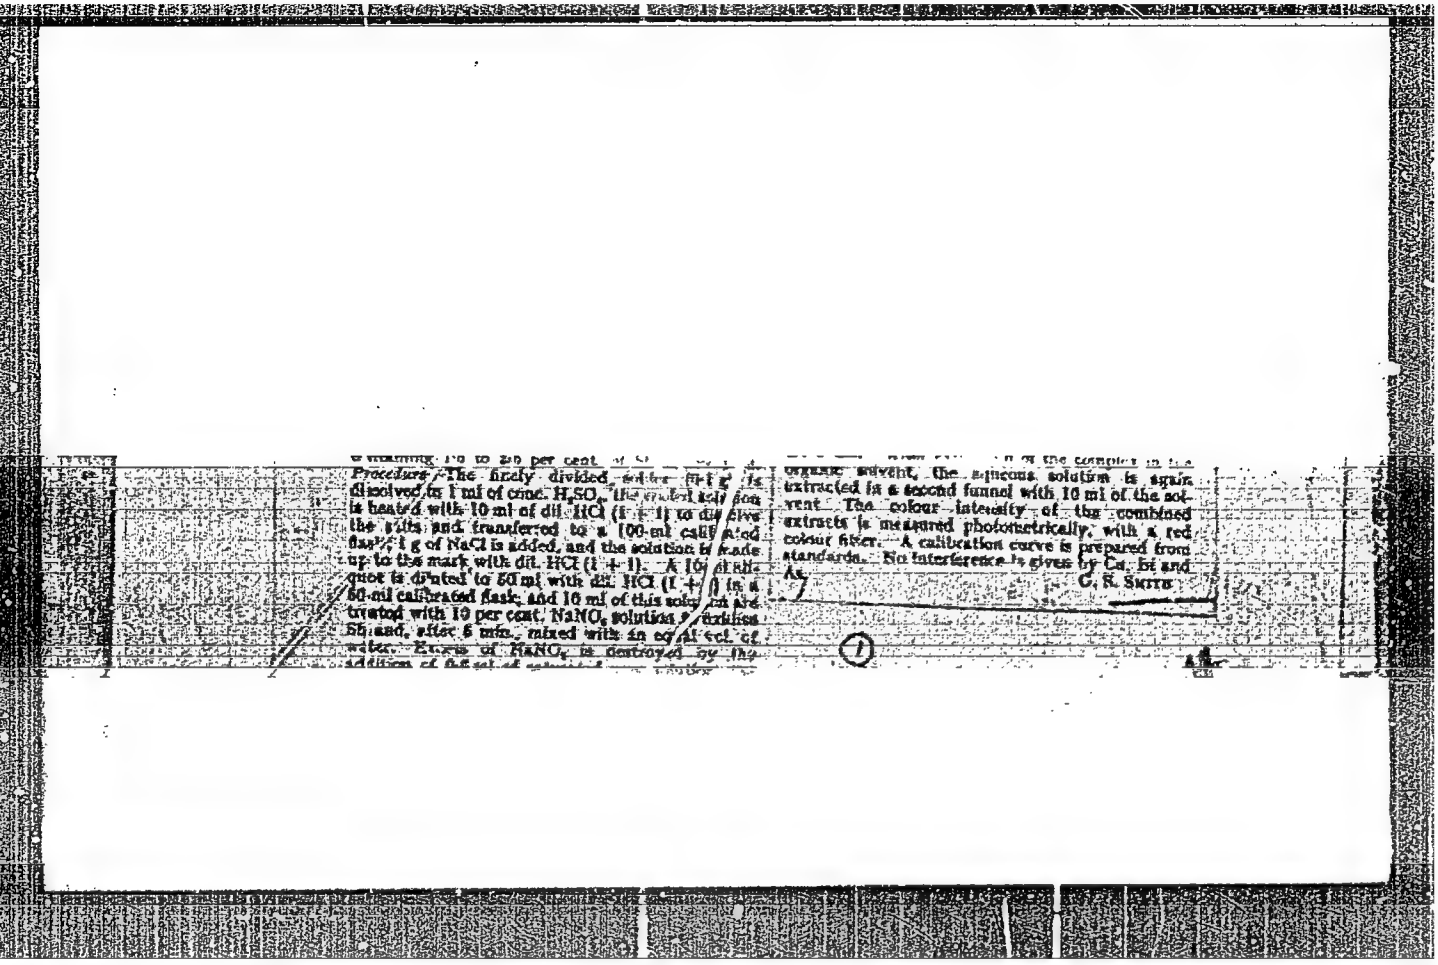
SO: Knizhnaya letopis', No. 4, Moscow, 1956



Procedure.—The finely divided [illegible] is dissolved in 1 ml of conc. H_2SO_4, the [illegible] is heated with 10 ml of dil. HCl (1 + 1) to dissolve the salts and transferred to a 100-ml calibrated flask. 1 g of NaCl is added, and the solution is made up to the mark with dil. HCl (1 + 1). A 10-ml aliquot is diluted to 50 ml with dil. HCl (1 + 1) in a 50-ml calibrated flask, and 10 ml of this solution are treated with 10 per cent. $NaNO_2$ solution, 5 drops of 55 and, after 5 min., mixed with an equal vol. of water. Excess of $NaNO_2$ is destroyed by the addition of [illegible]

organic solvent, the aqueous solution is again extracted in a second funnel with 10 ml of the solvent. The colour intensity of the combined extracts is measured photometrically, with a red colour filter. A calibration curve is prepared from standards. No interference is given by Cu, Bi and As.

system, was related to the metabolic disturbance of substances in the plants, especially Fe. With a lack of Cu in the soil Fe was deposited in the cover tissues of the roots, which resulted in their dying. Application of $CuSO_4$ in doses of 1 kg per 100 kg/hectare in experiments conducted on the Serovsky marshland (Tomskaya Oblast) lessened the degree of development of the disease and increased the harvest. -- Ye. p-Isopropyl-α-methylhydrocinnamyl alcohol. V. N. Eliseeva and A. A. Ilag. U.S.S.R. 66,301, May 31, 1946. p-Isopropyl-α-methylcinnamaldehyde is autoclaved with a lower monohydric alc., e.g., EtOH or iso-PrOH, in the presence of a Ni catalyst. The reaction product is p-isopropyl-α-methylhydrocinnamyl alc. The latter is used for the production of the corresponding aldehyde by oxidation.

TITLE: Wave Propagation in a Non-homogeneous Waveguide

PERIODICAL: Akusticheskiy zhurnal, 1960, Vol. 6, No. 3, pp. 284-291

TEXT: Special attention has been devoted in recent years to the propagation of electromagnetic and sound waves in natural waveguides over long distances. A theory of natural waveguides has also been developed, but only for homogeneous ones, i.e., waveguides whose properties remain unchanged along the line on which the waves propagate. Over distances between 1,000 and 10,000 km this assumption is hardly realized in nature. Real non-homogeneous waveguides offer a complicated problem which can be solved only by approximation methods. Exact solutions are only possible in very simple special cases. Such a case is studied in the present paper, and the exact solution is analyzed. The authors proceed from the assumption that the line of the waveguide is, for the major part, homogeneous, and that only a certain part, which is sufficiently distant from the wave source, has a transition zone of the length 2L, within which the properties of

Card 1/3

the waveguide may change. As usual, the wave field in the homogeneous part is given by the superposition of the normal waves. In the transition zone, the shape of the waves may change and the waves may be reflected partly or completely. Furthermore, 2L is assumed to be small as compared to the distance between the source and the transition zone, so that a divergence of the wave front in the horizontal direction within this zone is negligible. The line is assumed to be perpendicular to the transition zone. These assumptions make it possible to study the problem as a two-dimensional one. This two-dimensional problem is further specialized. The following relation is assumed to hold for the square of the wave number in the medium: $k^2(x,z) = k_o^2 \left[(1-a)/ch^2 \frac{z}{H} + b\ th\ \frac{x}{L} + a\right]$. If $0 < a < 1$, the axis of the waveguide is in the plane $z = 0$. Within the range $|x| \gg L$ the waveguide is homogeneous, and $|x| \lesssim L$ corresponds to the transition zone (Fig. 1). A differential equation is derived for the sound potential $\psi(x,z)$. It can be solved by separating the variables $[\psi(x,z) = X(x)Z(z)]$. Next, expressions are given for the reflection coefficient and the phase and group velocities. Finally, the problem is considered from the viewpoint of ray theory, and the following relation (24) is derived for the direction of the ray to the plane $z = 0$:

Wave Propagation in a Non-homogeneous Waveguide S/046/60/006/003/001/012
B006/B063

$dz/dx = \tan\chi = \sqrt{\left(\frac{1-a}{\mathrm{ch}^2 z/H} + a - m^2\right)/(b\ \mathrm{th}x/L + m^2)}$, where m is a function of the angle χ_0 which indicates the direction in which the ray is emitted from the source. (24) leads to equation (26) for the ray. Equation (24) is finally discussed. There are 3 figures and 6 references: 5 Soviet and 1 US.

TITLE: Spectra of autoelectrons emitted from semiconductors

PERIODICAL: Radiotekhnika i elektronika, v. 7, no. 4, 1962, 670 - 686

TEXT: The energy spectra of autoelectrons emitted from the semiconductor SiO_2 + C were measured in detail for various autocurrent densities and emitter temperatures; the results are compared with the current-voltage characteristics of the emission, and with theoretical predictions that assume spherical energy surfaces and approximate electron temperatures. The present work was carried out in order to test a theory of autoelectron emission that relates the autocurrent density to the average internal electric field in the semiconductor, and hence to explain the experimental results at high autocurrent densities (previous theories are inadequate at autocurrent densities of above about 500 - 1000 amp./cm^2); also, the results give information about the energy distribution of the elec-

Card 1/2

trons in a semiconductor. The results show the non-equilibrium nature of the emission at high current densities. The electrons in the semiconductor are superheated by the strong internal field, which increases as the emission current density increases. In some cases electrons with energies of about 10 eV are found; the corresponding electron temperatures are about 10,000 - 15,000°K compared with equilibrium emitter temperatures ranging from about 300 - 1600 °K. The electron temperature decreases as the lattice temperature increases. The autoelectrons have a Maxwellian energy distribution at higher energies; therefore the energy distribution of the electrons in the semiconductor is probably also Maxwellian at these energies. There are 18 figures, 2 tables and 11 references: 7 Soviet-bloc and 4 non-Soviet-bloc. The references to the English-language publications read as follows: R.D. Young, E.W. Muller, Phys.
